

SAUCEDEMO - DEFECT MANAGEMENT

QA-DM-001 | Version 1.0 | Prepared by Nancy McKenzie | Manual QA Portfolio Project

Defect-management framework for documenting real failures discovered during SauceDemo test execution. No defects are pre-populated because execution has not yet produced confirmed findings.

Area	Portfolio Standard	Current Status
Defect Register	Link each confirmed defect to Test Case, Scenario, Requirement, evidence, severity, priority, and lifecycle status.	Ready - 0 defects logged
Severity	Critical, High, Medium, Low based on functional/business impact.	Defined
Priority	P1-P4 based on urgency and scheduling.	Defined
Lifecycle	New -> Confirmed -> In Progress -> Fixed -> Ready for Retest -> Closed, with Rejected/Deferred alternatives.	Defined
Retesting	Record Pass/Fail/Blocked after a fix is delivered.	Ready
Evidence	Reference screenshots or notes supporting the observed behavior.	Ready

Important: BUG IDs should be assigned only when an actual issue is confirmed. This keeps the portfolio evidence-based and prevents fictional defects from being presented as findings.
